

A NEW KIND OF EYE EXAM!

At Eye Care Optical, we want our patients to have the best and most comfortable eye exam possible. We are proud to say we now do our eye exams with the Optomap. The Optomap takes a picture of the entire back of the eye. This gives Dr. Bowman a much better view than using the microscope. The image can be enlarged to see better detail and can be studied very intently. The image is also used to see changes from year to year. We can detect eye disease before you would notice your vision changing. The best part is, most patients will not require the dilating drops. The Optomap is a single flash in each eye. It is a quicker and more comfortable exam. Dr. Bowman will get a detailed view of the optic nerve, arteries, veins, macula, and entire retina. The doctor will bring the images up on the computer and review this with you. The Optomap can detect glaucoma, diabetes, high blood pressure, macula degeneration, floaters, tears and holes in the retina, basically, any eye disease in the back of the eye. This procedure should be done on every patient every year as part of the routine eye exam. It is our new and exciting eye exam !!! The Optomap exam in just \$29 copay.
